

RAW MATERIAL RECEIVING CONTAINER

Our company don't build standard receiving container, because every rendering plant require its own one.

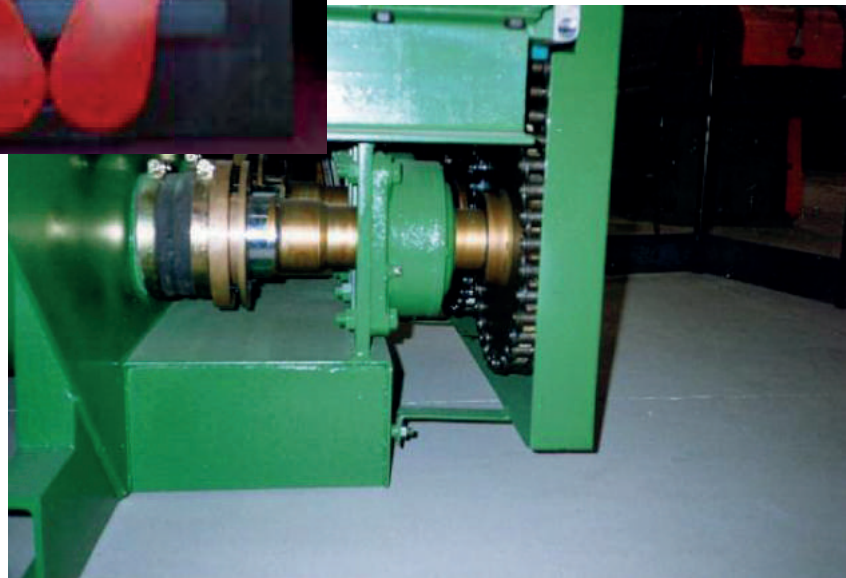

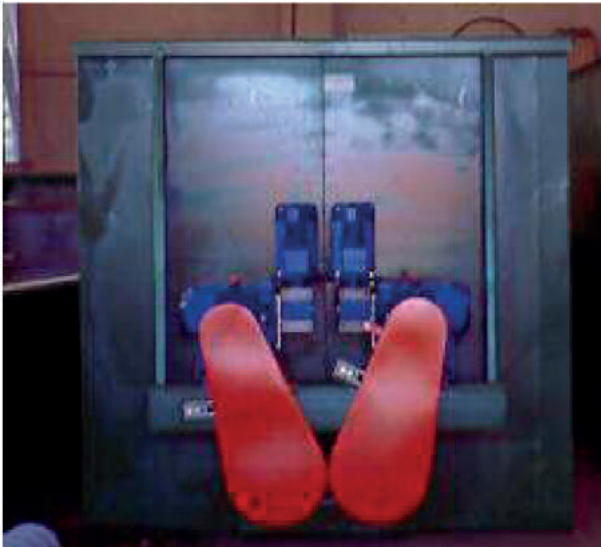

Meccar Impianti S.r.l. built container in carbon steel or in stainless steel, with cover or without.

The number of screws vary from 2 to 5 according to the size of the container and to the type of raw material.

We have built container with capacity from 20 to 200 ton for mixed material, only for bones or for complete animals.

Every shaft of the screws on the bottom of the container is equipped with bronze stuffing box flanges, sliding on carbonized and ground steel bushings, that assure a perfect seal.

Every screw is equipped with one parallel axis geared motor connected to the conveyor drive shafts by roller chain.

The velocity of the screw and the rotating direction can be modify directly from the control panel.
